Cloning of DST transponders

Currently, only Toyota and Yamaha keys are supported. For more details, Toyota supported keys have the 1-st page from the following set:
X0
X2
X3
X4*

X4* - only european market supported.

Run the Clone Mode selecting the appropriate menu item:

![Clone Mode](image)

The next screen will appear:

![Next Screen](image)

Place an original key on the Tango and click “Read original key” button:
Once the TIRIS DST or DST+ transponder detected the “Decode Transponder” button appears:

Click the “Decode Transponder” button. The dialog window about your intention will appear. On this dialog, click YES button:

Tango will run the decoding process:

In case the decoding finishes successfully the “Write Clone” button will appears:
Now, remove the original key and replace it with EH2 (battery emulator) or TPX2 transponder. You are all set to make a clone. Click the “Write Clone” button and Tango will do it.
